### Question 1.

The System Development Methodology is the approach used to develop a particular information system, whereas the System Development Life Cycle is the process of activities needed to build, launch, and maintain an information system.

### Question 2.

- i. An *Event* is an occurrence that takes place at a given time and location. An *External Event* is a non-system event that is usually originated by an external agent or actor. A *Temporal Event* is something that happens as a result of reaching a certain point in time. A *State Event* is an event that occurs when something arises within the system that initiates a procedure.
- ii. All external, temporal, and state events are identified using the event decomposition technique. For each event, a use case will be identified and designated to describe the system's function when the event occurs. Because EBP is the same level as a use case definition, it identifies use cases at the appropriate level of analysis.

### Question 3.

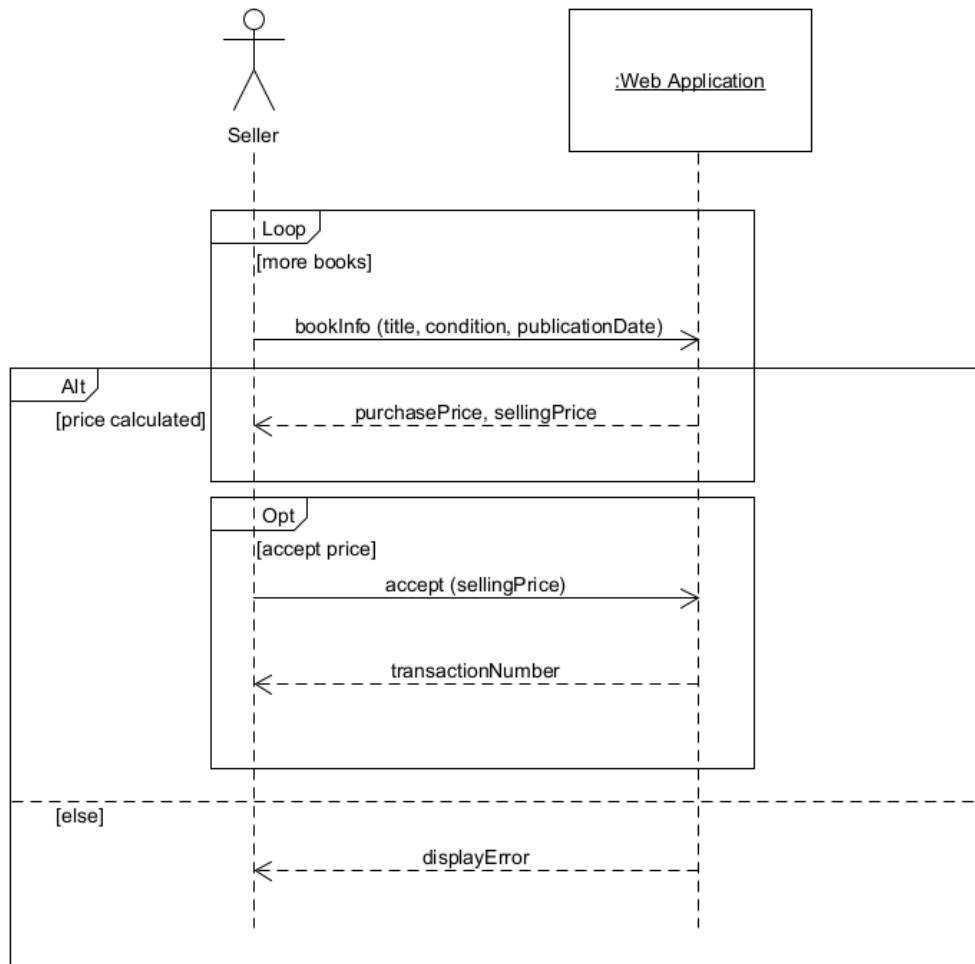

- i. Four basic approaches to program development order:
  - a. Input, process, output (IPO)
    - A development order that implements input modules first, process modules second and output modules last
  - b. Top-down development
    - Implements top-level modules first
  - c. Bottom-up development
    - Implements low-level detailed modules first
  - d. Use-case driven
    - Selects specific use cases and orders the development based on said use cases
- ii. Iterative development is a method of system development in which the system is established piece by piece over the course of several iterations. After completing a small portion of the system, the core procedures are repeated to refine and add to the system until it is complete. Use-case-driven development is well suited to iterative development since a new use case can be chosen for each iteration based on the present state of the system.

#### Question 4.

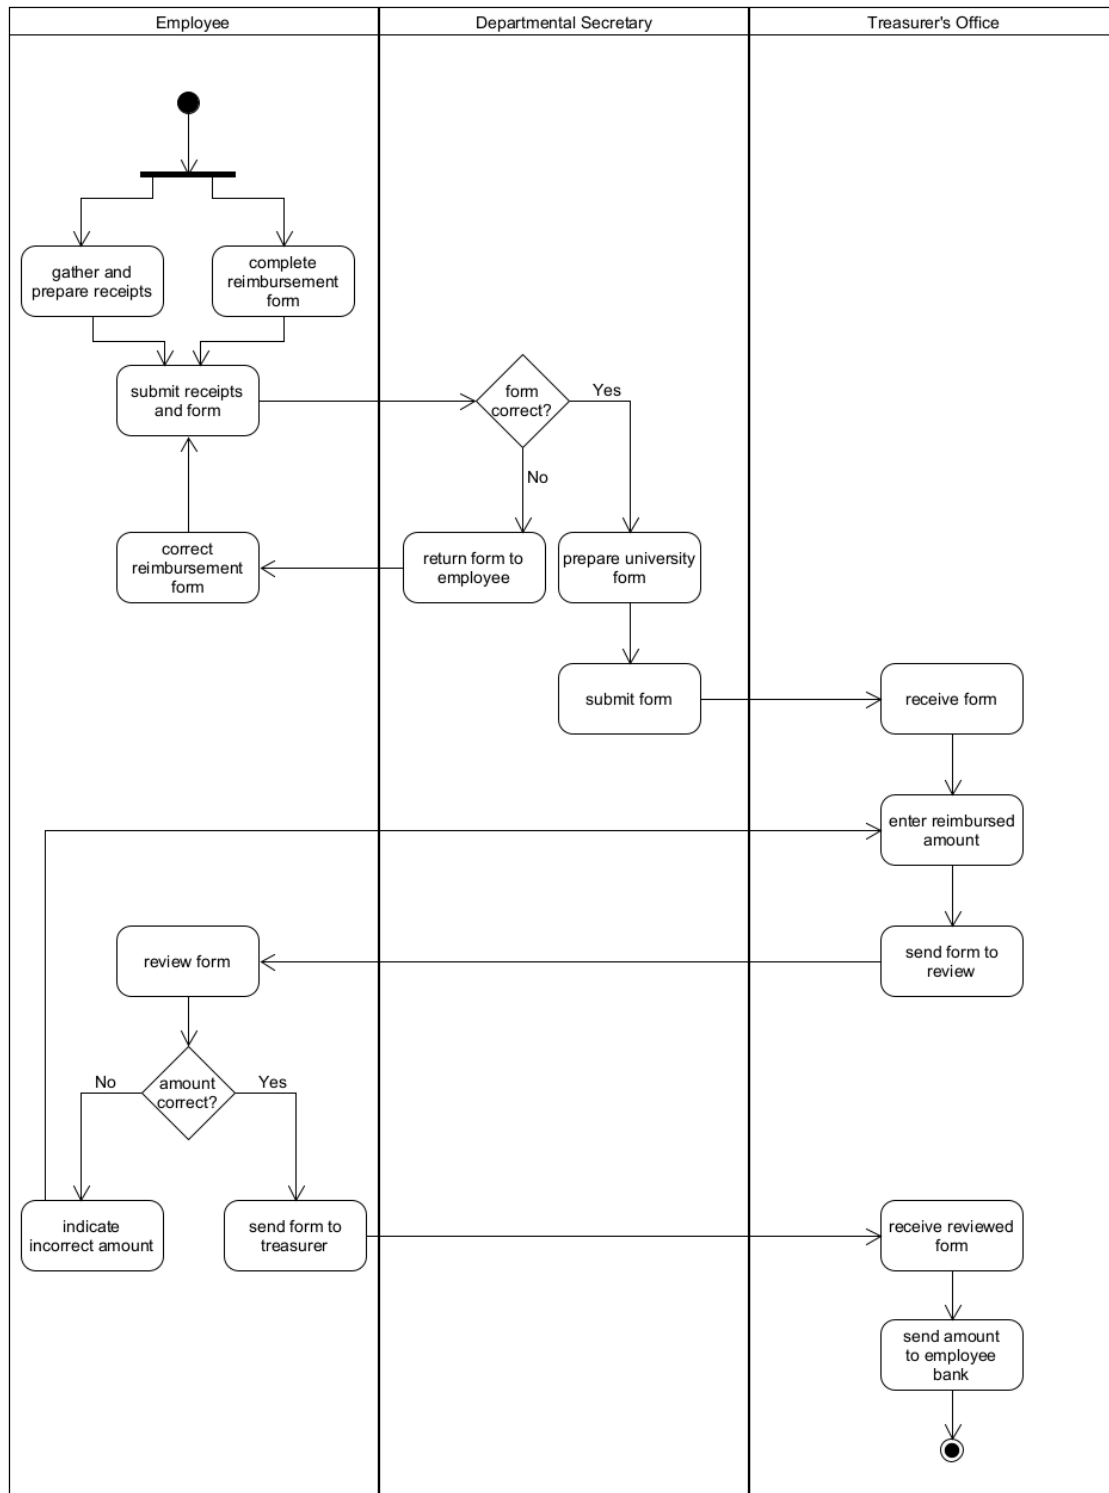

- i. **CRUD Analysis** the *Buyer* domain class:

CRUD	Use case
Create	Register buyer membership
Read/report	Display transaction details
Update	Loan book
Delete	Cease buyer membership

- ii. **System Sequence Diagram** showing the communication between the *seller* and the *web application* when *selling a book*

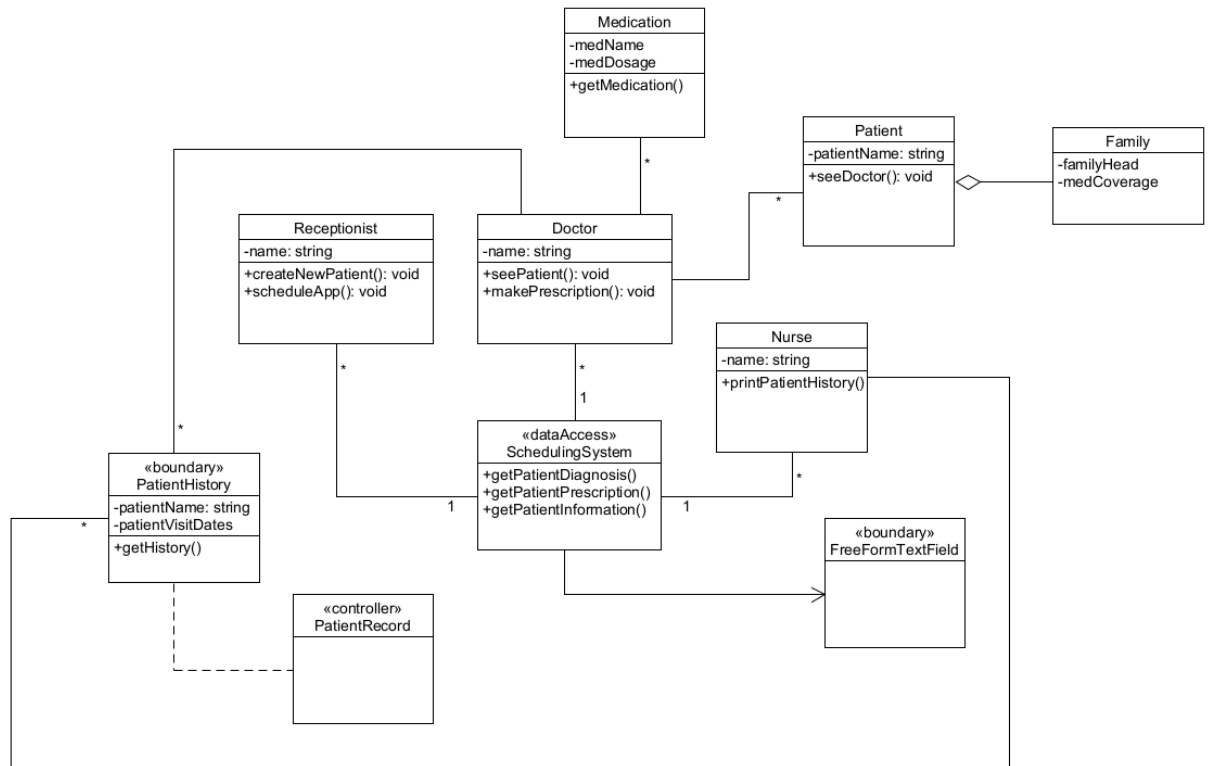

# Question 5.

## Question 6.

i.

ii.

Use case	Brief use case description
View patient history	Doctor/nurse enters patient information, system retrieves patient history and displays the data, system prints history if needed
Prescribe medication	Doctor/nurse enters medication information to prescribe and the patient's information, system displays and prints the prescription
